IT service delivery models

Will the cloud make your datacentre redundant?

With many organisations under pressure and IT teams struggling at times to keep pace with fast-moving business requirements, some experts would have you believe that every workload running inside a private datacentre today is ultimately destined to move to the public cloud. But is this proposition really true?

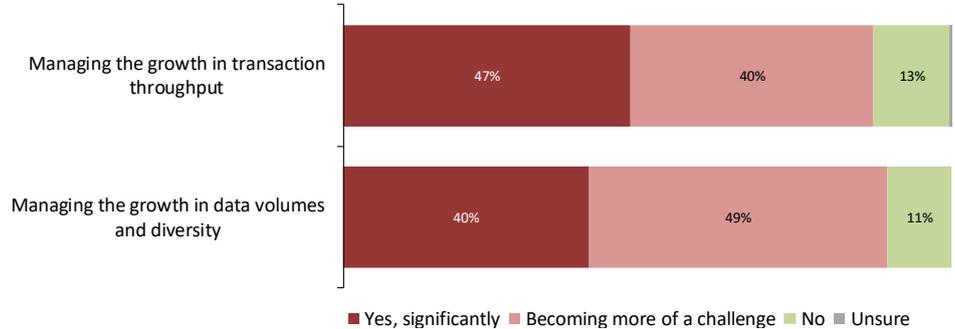

Freeform Dynamics recently conducted a survey among 320 datacentre professionals to learn their views on cloud computing and how their own datacentres fit into the grand scheme of things.

It became clear that respondents use a wide range of approaches to provide IT services to their organisations. These range from running services in their own datacentres and private hosted systems to global public clouds. But as to whether datacentres run by organisations themselves are becoming less important, the answer was a resounding no.

Organisations today are evolving at a rapid pace, which makes keeping up with the increasing adoption of IT systems in all areas of the business a considerable challenge for many IT teams.

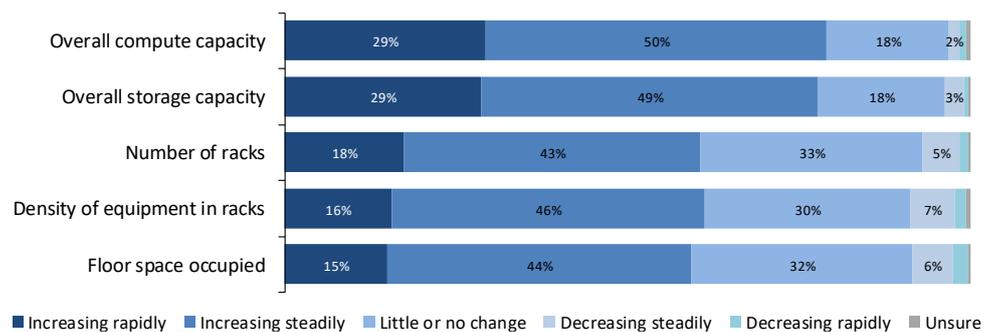

Keeping up with growth in the business use of IT systems is a considerable challenge for many IT teams.

Have [business] pressures led to any of the following datacentre related challenges?

Business reliance on services delivered by centralised IT systems leads, inevitably, to an increase in the demands made on many areas of datacentre IT capacity. It also increases the density of equipment in the datacentre itself.

Considering your datacentre environment overall, how are the following changing?

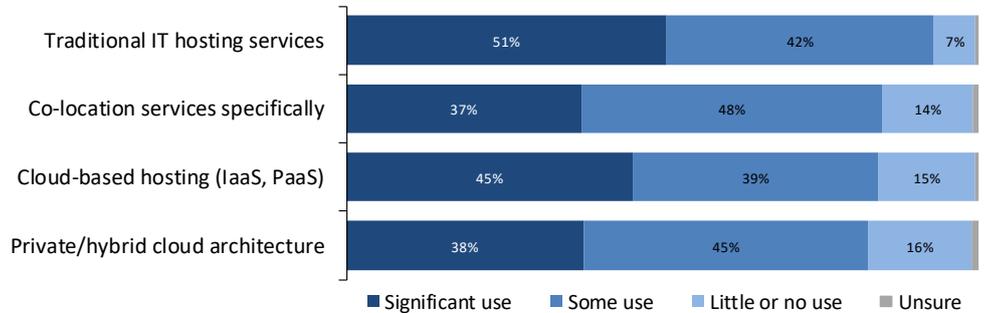

Business reliance on services delivered from the datacentre leads, inevitably, to an increase in demands on datacentre IT.

In addition to increasing the number of systems running inside their datacentres, many organisations make use of a number of external solutions.

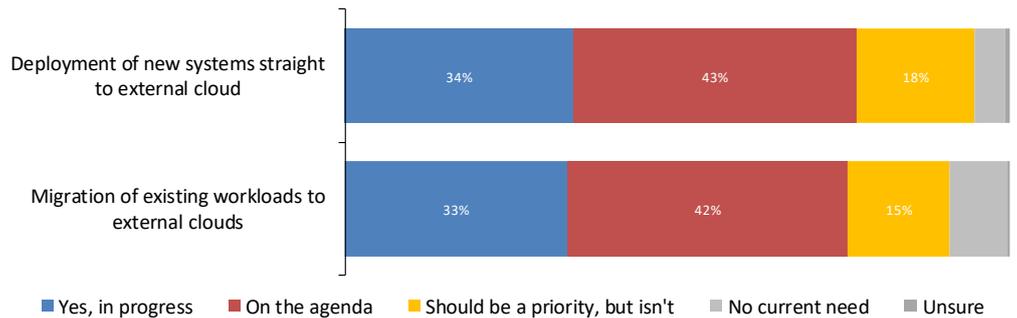

So in light of these pressures, what are organisations doing to ensure IT services are provided effectively? The survey reveals that, in addition to increasing the capacity of systems running inside their datacentres, many organisations are also using a number of external offerings. Of these, “cloud” is now right up there beside more traditional hosting solutions.

How would you describe your use of the following?

As to what the public cloud is being used for in particular, the research demonstrates that it is not being deployed simply to run new systems. Instead some organisations are also looking to migrate existing datacentre-based applications and workloads to it.

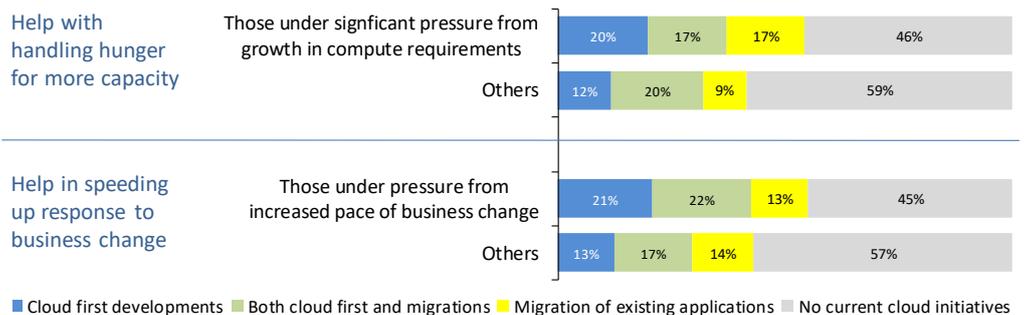

Do you have projects or initiatives in relation to datacentre modernisation?

Public cloud is not being used simply to run new systems.

The survey also shows clear evidence of multiple drivers for public cloud uptake. The approach is especially popular among organisations experiencing high levels of growth in demand for IT resources in general, and compute requirements in particular. It is also being adopted by organisations having to handle rapidly-changing business requirements. The attraction of the public cloud in this context is that it is possible for organisations to provision IT resources rapidly without needing to procure kit far in advance.

Do you have active cloud-related initiatives?

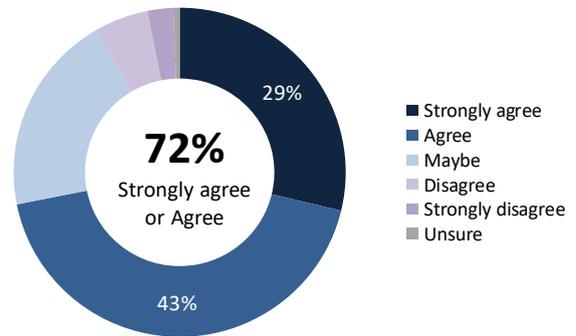

There is clear evidence of multiple drivers for public cloud adoption.

So does the public cloud signal the imminent demise of the datacentre? Contrary to what many cloud advocates would have you believe, the survey clearly indicates not.

The widespread use of public cloud solutions is not a sign that organisations are rushing to move everything out of their datacentres.

The widespread use of public cloud solutions and other hosted services do not signal that most organisations are rushing to move everything out of their datacentres as rapidly as possible in order to rely totally on the public cloud for their IT needs.

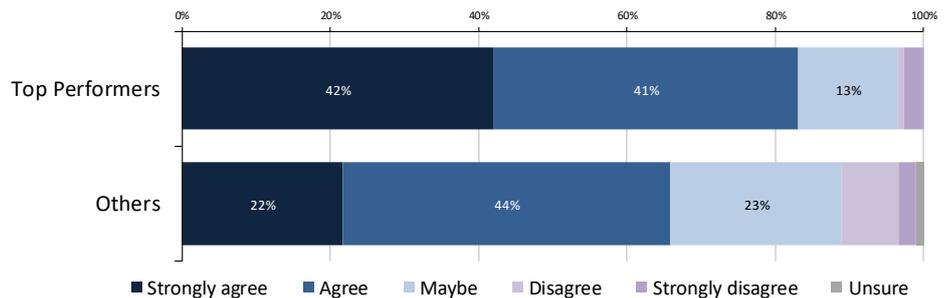

Operating our own datacentre(s) will remain critical to the business, despite the advent of cloud

A clear majority of organisations see their own datacentres as critical to their business operations.

A clear majority of organisations today still see their datacentres as critical to their business operations. The evidence for this is even stronger among Top Performing organisations – 30% of the survey base, who generally provide IT services more effectively than the rest of the research sample (see ‘About the Research’ section for more details).

Agree or disagree: Operating our own datacentre(s) will remain critical to the business, despite the advent of cloud

These findings reflect those of many other surveys carried out in recent years, namely that public cloud is regarded by most organisations as simply another means of delivering IT services rather than the be-all and end-all. It is good for some workloads, but not ideal for others. It is, in fact, just another option to be considered when working out how to provide a particular service or workload.

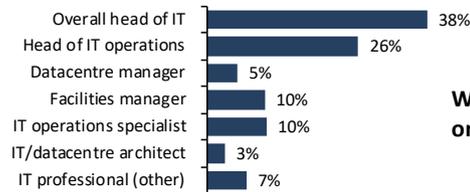

Most organisations will use their own datacentres or the public cloud where it makes sense.

As a result, most organisations will use their own datacentres and the public cloud where it makes sense. This situation will vary over time as IT demands continue to change rapidly. Steady-state is no longer the way of the IT world - if it ever was.

About the research

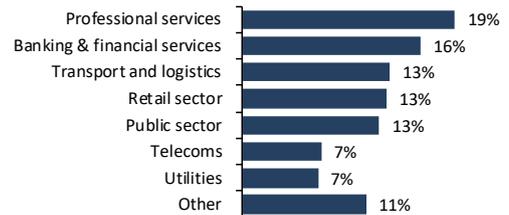

The research referenced in this document was designed and executed by Freeform Dynamics with sponsorship from Eaton. Input was gathered via an online survey of 320 datacentre professionals during September 2016.

Which of the following best describes your role?

RESEARCH SAMPLE

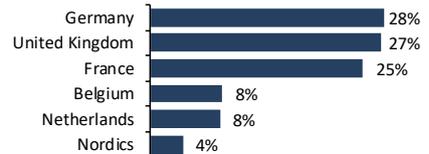

Which of the following best describes your organisation's core business?

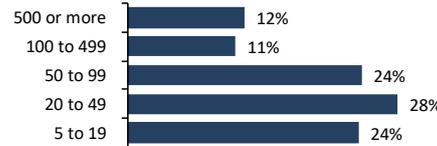

How many full-time employees work for your organisation worldwide?

Which country/region are you based in?

Approximately how many racks of equipment are installed in your datacentre(s) overall?

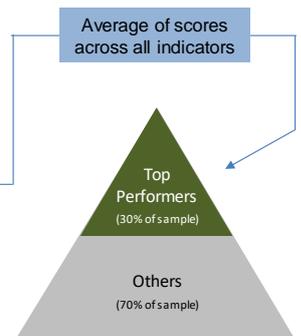

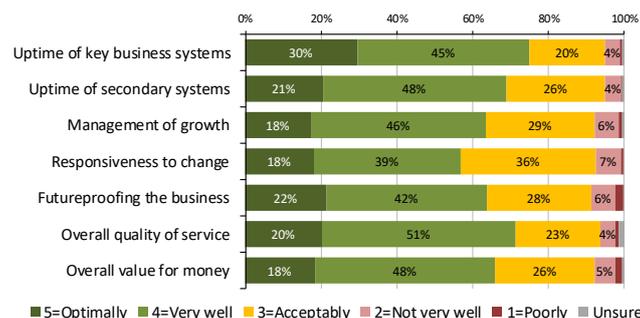

320 total respondents

Please note that the online methodology used tends to attract respondents who are more knowledgeable and/or interested in the subject matter being investigated. While every effort has been made to minimise this effect, the possibility of some degree of bias in the sample must be acknowledged. However, such limitations have been borne in mind when interpreting the research and are unlikely to have significantly impacted the observations and conclusions outlined.

'Top Performers'

Performance indicators were scored and analysed to identify 'Top Performers', i.e. the 30 percent with the best scores in the index created.

How well does your datacentre environment enable strong performance in the following areas?

About Freeform Dynamics

Freeform Dynamics is an IT industry analyst firm. Through our research and insights, we aim to help busy IT and business professionals get up to speed on the latest technology developments, and make better-informed investment decisions.

For more information, and access to our library of free research, please visit www.freeformdynamics.com.

About Eaton

Eaton is a power management company with 2015 sales of \$20.9 billion. Eaton provides energy-efficient solutions that help our customers effectively manage electrical, hydraulic and mechanical power more efficiently, safely and sustainably. Eaton has approximately 95,000 employees and sells products to customers in more than 175 countries. For more information, visit www.eaton.eu.
